

A PRACTICAL PRODUCTION SYSTEM

Brief clearly. Inspect deliberately.

A companion for the Image Production Briefs collection. Use it to make references, composition and approval decisions explicit.

One image. One visual promise.

Choose the image type, placement, audience and intended feeling before adding decorative detail. A product shot should explain the product; an editorial cover should support one idea.

What this guide adds

Reference roles, composition decisions, continuity locks, realistic materials and a repeatable review loop. The ten BRIEF templates provide the editable six-section structure.

RELATED REFERENCE

Golden Thread

Linked templates: BRIEF-006 / BRIEF-007

Original prompt: Not recorded

Engine: Not recorded

Status: Visual inspected; provenance unverified.

REFERENCE ROLES

Give every source a specific job.

A reference can guide appearance, materials, lighting or composition. It should not silently control everything.

1. Identify the authoritative source

List the file and the exact details to preserve. For a product, specify silhouette, proportions, part count, finish and approved label placement. For a person, use only visible traits relevant to continuity.

2. Separate reference roles

Example: reference A controls product geometry; B guides background composition; C guides light softness. Name which source wins if the instructions conflict.

3. Lock the invariants

Keep approved details consistent across outputs. A prompt is a request, so compare the result against the source. Do not treat an identity or product lock as a guarantee.

4. Keep the source record

Save the actual prompt, engine and version, settings, references, output and reviewer decision. If any are missing, label them as missing rather than inferring them from style.

COMPOSITION AND LIGHTING

Make room for the message.

Decide where the eye should land and where the final headline will sit before generating the image.

Choose the frame first

Name the viewing angle, focal point, subject position and copy zone. Check the intended desktop, mobile or social crop separately. Ratios are composition targets, not universal engine controls.

Build one lighting world

Subject, surface, background, reflections and shadows should agree on key-light direction and softness. Lens, aperture and Kelvin descriptions express a desired look; they do not prove physical capture settings.

Add exact typography in a layout editor

Generate a clean visual when possible, then place approved copy and logos using controlled fonts and spacing. If text is generated in the image, review every character and its legibility at delivery size.

Original prompt / engine: Not recorded

Review: Visual inspected; provenance unverified.

Existing headline means this is a layout reference, not a text-free output.

PRODUCTS AND CONTROLLED EDITS

Protect the details that carry meaning.

Material fidelity and an intentional correction loop matter more than adding more adjectives.

Product and material checks

Specify finish, texture scale, edge shape and the critical focus plane. Inspect the silhouette, small parts, labels, contact points and reflections. Concept images cannot verify real product specifications.

One correction per iteration

Name the observed defect and requested change. Preserve the rest of the approved composition, product and light. Use a mask if the engine supports it, then inspect the whole image for unintended changes.

Keep an approval trail

Compare before and after at full size. Save the change request and reviewer decision. Do not describe independently selected assets as a before-and-after pair without every detail.

Review: Visual inspected; provenance unverified.
Check dial details and geometry before commercial reuse.

REVIEW AND REUSE

Approve the result, not the intention.

Use these questions before an image becomes a public asset.

Does the visual deliver the brief?

Check focal priority, reference roles, continuity, realistic anatomy or geometry, material behavior, copy space, final crop and all visible text. Verify permissions and approved branding for the chosen use.

Does the evidence support the label?

A related reference is useful inspiration. A tested output needs its actual prompt, engine, settings and review record. Visual inspection alone does not establish the generating model or reproducibility.

When should another tool finish the work?

Use controlled layout tools for exact typography, tables and diagrams. Use approved technical assets and expert review for safety or procedural instruction. Verify export controls in your selected engine.

Source basis and editorial scope

Adapted from two WenceStudio source documents: Campaign Image Anatomy & Professional Reconstruction Guide, and Prompt to Pixel Issue 25 Blueprint Package. This public companion uses selected practical guidance. It omits internal vault material, unsupported performance claims and historical model comparisons.

Image examples are credited to the WenceStudio source collection. Original generating prompts and engines were not recorded in the selected source files. No linked recipe is certified by these examples.
